

Biodiversity Net Gain Assessment

Site Address:

Former Ambulance Station, Dorset Road, Belmont, SM2 6JH

Client:

Belmont and Sutton Muslim Assembly - BASMA

Assessment Date:

11th November 2025

Project:

This report is prepared to inform a planning application with the London Borough of Sutton. The proposal is described as:

Change of use from Use Class Sui Generis (ambulance station) to mixed-use classes F.1 (place of worship) and F.2 (community hub) including the erection of a single storey side and rear extension.

BNG assessment methodology and legislation can be found in the Arbtech Supplement: **BNG Methodology and Legislation – 2025.**

The results and recommendations contained within this report are valid for 18 months. An updated site visit and BNG assessment may be required if the report is to be used any longer than 18 months after completion.

Site Location and Context

A baseline habitat map is provided in **Appendix 1**, a post development habitat map in **Appendix 2**, a proposed development plan in **Appendix 3**, headline BNG results in **Appendix 4**, and condition assessments in **Appendix 5**.

The site is centred at National Grid Reference TQ 25317 62521 and has an area of approximately 0.12ha. The site contains a disused ambulance station, hardstanding, one ornamental hedgerow, modified grassland, and scattered trees. The site is situated along Dorset Road in the town of Sutton, South London. There are scattered trees within the site and extending into the local garden landscape. Aerial imagery shows the local landscape to predominantly feature urban built-up land, gardens, parkland and an area of woodland to the south of the site. A vegetated railway line is 310m to the east of the site. Such features likely enhance the area for a variety of species, including bats and nesting birds. The soil type is classified by Landis.org as freely draining slightly acid but base-rich soils.

This report should be read in conjunction with the following documents:

- ❖ Statutory BNG Metric – Former Ambulance Station, SM2 6JH – v1 (Arbtech Consulting Ltd., 2025)
- ❖ Proposed Plan (UWA, 2025)
- ❖ Preliminary Ecological Appraisal (PEA) – Former Ambulance Station, SM2 6JH – v1 (Arbtech Consulting Ltd., 2025)
- ❖ Tree Survey Report - Former Ambulance Station, SM2 6JH – v1 (Arbtech Consulting Ltd., 2025)

Executive Summary

- ❖ The sites baseline habitats produce 1.71 area-based habitat units (1.61 from urban trees and 0.1 from modified grassland) and 0.03 linear-based habitat units (all from non-native/ornamental hedgerow). To achieve the required BNG uplift of +10% for all onsite habitat types, 1.88 area-based and 0.033 linear-based habitat units will be needed to achieve BNG.
- ❖ The proposed development plan results in the loss of 0.03 area-based habitat units of modified grassland and a gain of 0.07 units from created urban trees and 0.03 in SuDS. Whilst this produces an onsite net gain of 4.37%, this is below the stated target uplift. Likewise, no additional linear-based habitats are provisioned as part of the development plan.
- ❖ To achieve BNG, a further 0.1 area-based and 0.003 linear-based habitats of low distinctiveness are required to be created post-development. Whilst there is scope to enhance existing grassland and plant additional urban trees, it may not be possible to carry out all the necessary soft landscaping enhancements simultaneously and thus offsetting might be required. The addition of the required linear-based habitats to achieve a post-development +10% uplift is not foreseen to be a barrier.

Introduction

BNG Informative		
Habitat Degradation Statement	Date reflected by BNG calculations	5 th November 2025
	The baseline biodiversity value of the site is derived from the site as observed during the PEAPRA field survey (Arbtech Consulting Ltd., 2025). As evident in the screenshots of satellite imagery obtained from GoogleEarth dated 29th June 2019 and 8th March 2025, the site does not appear to have undergone any degradation. The habitats on site, and therefore biodiversity value of the site, is not considered to have undergone degradation since 30th January 2020. Historical imagery < 29 Jun 2019 >  Historical imagery < 8 Mar 2025 > 	

Irreplaceable Habitat Statement	No irreplaceable habitats as listed under the Biodiversity Gain Requirements (Irreplaceable Habitat) Regulations (2024) are currently present nor were present before 30 th January 2020.	
Metric Version & Publication Date	Statutory Biodiversity Metric Calculation Tool first published 29 th November 2023 with last updates to metric tools and user guides on 3 rd July 2025.	
BNG Target Uplift	+10%	
National Character Area (NCA)	114 – London Basin Lowlands	
Strategic Significance	The Local Nature Recovery Strategy (LNRS) for the Greater London area is currently being developed, with a draft local habitat map published (https://londonlnrs.commonplace.is/en-GB/proposals/v3/document-library?step=step1); this draft LNRS habitat map was used to determine strategic significance. When the site is cross referenced on the habitat map, it is revealed that it falls within a Potential Measures Location for Green Corridors. As such, the site along with any baseline or proposed habitats are considered to be of elevated strategic significance. Within the draft LNRS, this Green Corridor Potential Measure Location (PM location ID: PM2368) contains a number of primary measures including but not limited to wildlife connectivity and tree/woodland/hedge/scrub	

	creation and management. Given the scale and nature of the development, these may not be directly applicable to the site but should be considered when ascertaining the strategic significance of habitats on site, both in the baseline and post-development.	
Limitations		
There were no specific limitations to the assessment.		

Baseline

Baseline Biodiversity Value: On-Site				
Area-Based Habitats (A-1)				
Habitat	Area (ha)	Description	Condition Assessment	Strategic Significance
Modified Grassland	0.0432	The north and western boundaries and southeast corner of the site are vegetated. The southeast corner is characteristic of a grass lawn, frequently mown with a short and uniform sward of ~5cm and consisting of five vascular species per m ² . The grass is DOMINATED by perennial ryegrass with ABUNDANT white clover, FREQUENT dandelion, yarrow, ribwort plantain, bulbous buttercup, birds foot trefoil and OCCASIONAL green alkanet. The western boundary is comprised of ABUNDANT green alkanet and FREQUENT perennial ryegrass. The northern boundary - due to its hedge and tree cover- is DOMINATED by bare ground and leaf litter with FREQUENT ivy, OCCASIONAL perennial ryegrass, green alkanet, annual mercury, herb Robert and RARE wood avens, cleavers, nettle, holly and common sowthistle.	<i>Poor: passes 4 of 7 criteria excluding essential criterion A.</i> Assessed using the 'Grasslands Low Distinctiveness' habitat type condition sheet.	Medium Strategic Significance
Developed land, sealed surface	0.0834	Concrete hardstanding dominates the site, forming the site entrance and parking area. There are two buildings on site. B1 is a small, single storey, disused ambulance station. B2 is a row of disused shower cubicles. Further building descriptions and ecological assessments are provided in the Bats appraisal section.	Habitat condition pre-determined as ' N/A ' as detailed within the Statutory Biodiversity Condition Assessment Supplement.	

Urban Tree	Good: 0.1221	Eight trees were considered in the baseline, all scattered around the site boundary. All trees achieve 'good' condition by passing 5 of 6 criteria.	Good: passes 5 of 6 criteria. Four small (T1, T2, T3 & T7) Two medium (T4 & T8) Two large (T5 & T6)	Medium Strategic Significance
------------	-----------------	---	---	--

Baseline Biodiversity Value: On-Site

Linear-Based Habitats (B-1)

Habitat	Length (km)	Description	Condition Assessment	Strategic Significance
Non-native/ornamental hedgerow	0.024	Along most of the northern site boundary is a hedgerow comprised exclusively of garden privet (<i>Ligustrum ovalifolium</i>). The hedgerow is not of a typical structure due to being completely unmanaged but significantly lacking in volume. It is more characteristic of a line of saplings, but due to all having a diameter at breast height (DBH) of less than 7cm, has been classified as a hedgerow. The foliage is not dense and therefore many gaps and openings are present. The hedgerow measures approximately 15m long, 2m wide and 5m tall.	Habitat condition pre-determined as ' poor ' as detailed within the Statutory Biodiversity Condition Assessment Supplement.	Medium Strategic Significance

Post-Development

Post-Development Biodiversity Value: On-Site

Area-Based Habitats

	Habitat	Area (ha)	Description	Condition Assessment	Strategic Significance
Retained (A-1)	Modified Grassland	0.03	The majority of the modified grassland on site will be retained, although the overall coverage on site will be reduced by ~130m ² . Species include perennial ryegrass, white clover, dandelion, yarrow, ribwort plantain, bulbous buttercup, birds foot trefoil and green alkanet.	Poor: passes 4 of 7 criteria excluding essential criterion A. Assessed using the 'Grasslands Low Distinctiveness' habitat type condition sheet.	Medium Strategic Significance
	Developed land, sealed surface	0.0834	Whilst adjustment to the buildings and other developed land are part of the development plan, the baseline sealed surface area will be retained.	Habitat condition pre-determined as ' N/A ' as detailed within the Statutory Biodiversity Condition Assessment Supplement.	
	Urban Tree	Good: 0.1221	All existing baseline trees will be retained. Species include Hawthorn, Cherry plum, Damson plum, Black poplar, English walnut and Holly.	Good: passes 5 of 6 criteria. Four small (T1, T2, T3 & T7) Two medium (T4 & T8) Two large (T5 & T6)	
Created (A-2)	Sealed Surface	0.0002	Additional sealed surface will be created as part of the development plan.	Habitat condition pre-determined as ' N/A ' as detailed within the Statutory Biodiversity Condition Assessment Supplement.	Medium Strategic Significance
	Sustainable drainage system	0.0132	Permeable paving will be implemented to	Moderate: passes 3 of 5 criteria	
	Urban Tree	Moderate: 0.0204	5no. small trees in moderate condition will be created.	Poor: passes 4 of 6 criteria.	

Post-Development Biodiversity Value: On-Site**Linear-Based Habitats**

	Habitat	Length (km)	Description	Condition Assessment	Strategic Significance
Retained (B-1)	Non-native/ornamental hedgerow	0.024	All of the existing onsite hedgerow will be retained as part of the development plan. This hedgerow consists exclusively of privet.	Habitat condition pre-determined as ' poor ' as detailed within the Statutory Biodiversity Condition Assessment Supplement.	Medium Strategic Significance

Change of Biodiversity Value

		Biodiversity Units	
		Area-Based	Linear-Based
On-Site	Baseline	1.71 ❖ Modified Grassland (0.1) ❖ Urban Trees (1.61) ❖ Sealed Surface (0)	0.03 ❖ Non-native/Ornamental Hedgerow (0.03)
	Post-Development	1.78 ❖ Modified Grassland (0.07) ❖ SuDS (0.03) ❖ Urban Trees (1.68) ❖ Sealed Surface (0)	0.03 ❖ Non-native/Ornamental Hedgerow (0.03)
	Net Change	0.07 (+4.37%)	0
	Overall Net Change	0.07 (+4.37%)	0

Results, Discussion, and Next Steps

BNG Informative	
Results	The current landscaping proposal generates a net gain of area-based habitat units (+4.37%) and no change in linear-based habitat units. Whilst trading rules have been satisfied (with the Statutory Biodiversity Metric User Guide (2024) stating any loss of a habitat must be replaced on a like-for-like or like-for-better principle), the proposal does not achieve the required net gain in either area-based or linear-based habitat units. As such, the proposal fails principal Rule 2 of BNG, and in order to be compliant with current legislation (Environment Act 2021) and planning policies (National Planning Policy Framework, 2024) additional biodiversity enhancements will be required to achieve a 10% biodiversity uplift onsite. To satisfy trading rules, a minimum of 1.88 units of area-based habitat must be provisioned (which means an additional 0.1 on top of the current plan) as well as a minimum 0.033 of linear-based habitat units (an additional 0.003).
Recommendations and Next Steps	In order to achieve the required net gain in biodiversity as a result of the proposed development, the provision of additional or alternative landscaping should be explored and the proposed plans amended accordingly to achieve a net gain on site. The provisioning of additional landscaping should first be considered within the site boundary. There is potential scope to achieve an improved or complete uplift onsite. However, given the limited soft landscaping available within the parcel, there may not be sufficient space to carry out all of the required enhancements simultaneously. Additional area-based habitat units can be achieved by enhancing the condition of the existing Modified Grassland (low distinctiveness), as well as planting additional Trees (medium distinctiveness). Enhancing the entire area of post-development Modified Grassland to 'moderate' condition would create an additional 0.04 area-based habitat units, although any further condition enhancement to 'good' would be likely be unfeasible. The enhancement of this habitat type should be achieved by boosting the number of vascular plants found within the plot (criterion A on the 'Grassland' habitat condition assessment). This would leave 0.06 area-based habitat units needed to achieve the target of 1.88 units for the site, which could be achieved by the provision of 5 additional small trees of 'moderate' condition. As individual trees are of a higher distinctiveness (medium) than modified grassland (low), this is a valid means of enhancing onsite habitat units whilst adhering to the BNG trading rules. It is completely feasible to achieve the required 10% uplift in linear-based habitat units, with a 3m extension of the existing hedgerow required. This should be a native hedgerow species. This could be added as an addition to the existing hedge or elsewhere onsite.

	It may not be possible to achieve all of the necessary habitat creation/enhancement without notable changes to the proposals on site. As such, a financial contribution to off-site ecological enhancements (i.e. purchasing biodiversity units) within an approved scheme may be required to make up the +10% net gain for area-based habitat units. The mechanism for securing this offsetting will need to be proposed to and confirmed by the LPA and would be linked to the application through a planning obligation Section 106 (s106) agreement. The proposed habitat compensation must be of an appropriate distinctiveness to meet the trading rules of BNG. A summary as to what off-site units will be required is detailed in the table below. The calculations assume that none of the suggestions for area-based habitat creation/enhancement have been accepted. <table><tr><td></td><td>Distinctiveness</td><td>Broad Habitat Group</td><td>Habitat</td><td>Units Required</td></tr><tr><td rowspan="3">Area-Based</td><td>Medium</td><td>Individual Trees</td><td>Urban Tree</td><td>0.06</td></tr><tr><td>Low</td><td>Grassland</td><td>Modified Grassland</td><td>0.04</td></tr><tr><td colspan="3">Total</td><td>0.1</td></tr></table> Depending on which alterations are accepted and incorporated into the development plan, this BNG Assessment will need to be updated to accurately reflect the change in biodiversity value of the site pre- and post-development.		Distinctiveness	Broad Habitat Group	Habitat	Units Required	Area-Based	Medium	Individual Trees	Urban Tree	0.06	Low	Grassland	Modified Grassland	0.04	Total			0.1
	Distinctiveness	Broad Habitat Group	Habitat	Units Required															
Area-Based	Medium	Individual Trees	Urban Tree	0.06															
	Low	Grassland	Modified Grassland	0.04															
	Total			0.1															
Pre-Commencement	A Biodiversity Gain Plan (BGP)) must be produced for the site. This should include recommendations for the implementation of the measures ensure the site provides the necessary 10% uplift for area and linear-based habitats. These additional requirements can only be actioned following the finalisation of the BNG assessment – be it on-site or off-site net gains sought.																		
BNG Mitigation Hierarchy																			
Avoidance	The nature of the proposed development plan means that avoidance is not possible.																		
Minimisation	The nature of the proposed development plan means that minimisation is not possible.																		
Mitigation	Whilst it will be possible to mitigate some of the impact of the proposed development plan, this may not be sufficient to provide the necessary post-development uplift.																		
Offset	The nature of the proposed development plan means that offsetting may be necessary to achieve the necessary post-development uplift.																		

Appendix 1: Baseline Habitat Plan

Appendix 2: Post-Development Habitat Plan

Appendix 4: Headline BNG Results

FINAL RESULTS			
Total net unit change (Including all on-site & off-site habitat retention, creation & enhancement)	<i>Area habitat units</i>	0.07	
	<i>Hedgerow units</i>	0.00	
	<i>Watercourse units</i>	0.00	
Total net % change (Including all on-site & off-site habitat retention, creation & enhancement)	<i>Area habitat units</i>	4.37%	Total net gain achieved is less than target set ▲
	<i>Hedgerow units</i>	0.00%	Total net gain achieved is less than target set ▲
	<i>Watercourse units</i>	0.00%	
Trading rules satisfied?	Yes ✓		

Appendix 5a: Baseline Habitat Condition Assessment Sheets

Modified Grassland; assessed using 'Grasslands Low Distinctiveness' habitat type condition sheet:

Condition Assessment Criteria:		Condition passed (Yes or No)	Notes/Justification
A	There must be 6-8 vascular plant species per m ² , including at least 2 forbs. Note – this criterion is essential for achieving moderate condition.	N	Fewer than 6 vascular plant species per m ² .
B	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for vertebrates and invertebrates to live and breed.	N	Regularly mown, uniform sward height present.
C	Some scattered scrub (including bramble) may be present, but scrub accounts for less than 20% of total grassland area. Note - patches of shrubs with continuous (more than 90%) cover should be classified as the relevant scrub habitat type.	Y	No scattered scrub present (less than 20% coverage).
D	Physical damage is evident in less than 5% of total grassland area. Examples of physical damage include excessive poaching, damage from machinery use or storage, erosion caused by high levels of access, or any other damaging management activities.	Y	Physical damage present in less than 5% of total grassland area.
E	Cover of bare ground is between 1% and 10%, including localised areas (for example, a concentration of rabbit warrens).	N	Bare ground cover over 10%.
F	Cover of bracken less than 20%.	Y	No bracken observed (less than 20% coverage).
G	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981).	Y	Absence of invasive species.
Essential criterion achieved (Y/N)			N
Number of criteria passed			4
Condition Assessment Result		Condition Assessment Score	Score Achieved ✓
Passes 6 or 7 of 7 criteria including passing essential criterion A		Good (3)	
Passes 4 or 5 of 7 criteria including passing essential criterion A		Moderate (2)	
Passes 0, 1, 2 or 3 of 7 criteria; OR 4, 5 or 6 of criteria but failing criterion A		Poor (1)	✓

Urban Trees; assessed using 'Individual Trees' habitat type condition sheet:

Condition Assessment Criteria		Condition Achieved (Y/N)	Notes/Justification
A	The tree is a native species (or more than 70% within the block are native species).	Y	Trees on site are native.
B	The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5 m wide (individual trees automatically pass this criterion).	Y	All trees are individual trees and thus automatically pass this criterion.
C	The tree is mature (or more than 50% within the block are mature).	Y	Trees are mature.
D	There is little or no evidence of an adverse impact on tree health by anthropogenic activities such as vandalism or herbicide use. There is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.	Y	Little to no evidence of adverse anthropogenic impacts; all trees have retained >75% of their expected canopy.
E	Natural Ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.	N	None observed.
F	More than 20% of the tree canopy area is oversailing vegetation beneath.	Y	More than 20% of the tree canopy area has vegetation underneath.
Number of criteria passed			5
Condition Assessment Result	Condition Assessment Score	Score Achieved ✓	
Passes 5 or 6 of 6 criteria	Good (3)	✓	
Passes 3 or 4 of 6 criteria	Moderate (2)		
Passes 0, 1 or 2 of 6 criteria	Poor (1)		

Appendix 5b: Post-Development Habitat Condition Assessment Sheets

Modified Grassland; assessed using 'Grasslands Low Distinctiveness' habitat type condition sheet:

Condition Assessment Criteria:		Condition passed (Yes or No)	Notes/Justification
A	There must be 6-8 vascular plant species per m ² , including at least 2 forbs. Note – this criterion is essential for achieving moderate condition.	N	Fewer than 6 vascular plant species per m ² .
B	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for vertebrates and invertebrates to live and breed.	N	Regularly mown, uniform sward height present.
C	Some scattered scrub (including bramble) may be present, but scrub accounts for less than 20% of total grassland area. Note - patches of shrubs with continuous (more than 90%) cover should be classified as the relevant scrub habitat type.	Y	No scattered scrub present (less than 20% coverage).
D	Physical damage is evident in less than 5% of total grassland area. Examples of physical damage include excessive poaching, damage from machinery use or storage, erosion caused by high levels of access, or any other damaging management activities.	Y	Physical damage present in less than 5% of total grassland area.
E	Cover of bare ground is between 1% and 10%, including localised areas (for example, a concentration of rabbit warrens).	N	Bare ground cover over 10%.
F	Cover of bracken less than 20%.	Y	No bracken observed (less than 20% coverage).
G	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981).	Y	Absence of invasive species.

Passes 4 or 5 of 7 criteria including passing essential criterion A	Moderate (2)		
Passes 0, 1, 2 or 3 of 7 criteria; OR 4, 5 or 6 of criteria but failing criterion A	Poor (1)	✓	

Urban Trees; assessed using 'Individual Trees' habitat type condition sheet:

Condition Assessment Criteria		Condition Achieved (Y/N)	Notes/Justification
A	The tree is a native species (or more than 70% within the block are native species).	Y	Trees should be native.
B	The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5 m wide (individual trees automatically pass this criterion).	Y	All trees are individual trees and thus automatically pass this criterion.
C	The tree is mature (or more than 50% within the block are mature).	N	Planted trees won't be mature.
D	There is little or no evidence of an adverse impact on tree health by anthropogenic activities such as vandalism or herbicide use. There is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.	Y	Little to no evidence of adverse anthropogenic impacts; all trees have retained >75% of their expected canopy.
E	Natural Ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.	N	None likely to be observed.
F	More than 20% of the tree canopy area is oversailing vegetation beneath.	Y	More than 20% of the tree canopy area will have vegetation underneath.
Number of criteria passed			5
Condition Assessment Result		Condition Assessment Score	Score Achieved ✓
Passes 5 or 6 of 6 criteria		Good (3)	
Passes 3 or 4 of 6 criteria		Moderate (2)	✓
Passes 0, 1 or 2 of 6 criteria		Poor (1)	

SuDS; assessed using the 'Urban' habitat type condition sheet:

Condition Assessment Criteria		Criterion passed (Yes or No)	Notes/Justification
Core Criteria - must be assessed for all urban habitat types :			
A	Vegetation structure is varied, providing opportunities for vertebrates and invertebrates to live, eat and breed. A single structural habitat component or vegetation type does not account for more than 80% of the total habitat area.	Y	Species should provide varied vegetation structure.
B	The habitat parcel contains different plant species that are beneficial for wildlife, for example flowering species providing nectar sources for a range of invertebrates at different times of year.	N	
C	Invasive non-native plant species (listed on Schedule 9 of WCA) and others which are to the detriment of native wildlife (using professional judgement) cover less than 5% of the total vegetated area. Note – to achieve good condition, this criterion must be satisfied by a complete absence of invasive non-native species (rather than <5% cover).	Y	Absence of non-native plant species in species list.
Additional Criteria – must be assessed for SuDS habitat types only:			
E1	Plant species are mostly native. If non-native species are present, they should not be detrimental to the habitat or native wildlife.	Y	Species proposed should be at least 50% native.
E2	The vegetation is comprised of plant species suited to wetland or riparian situations.	N	
Essential criteria relevant for habitat type achieved (Yes or No)			Y
Number of criteria passed			4
Condition Assessment Result		Condition Assessment Score	Score Achieved ✓
Results for SuDS (requiring assessment of 5 criteria - core criteria plus additional criteria specified for habitat type):			
Passes all 3 core criteria AND Meets the requirements for good condition within criterion C AND Passes all additional criterion relevant to specific habitat type (Group E)		Good (3)	
Passes 3 or 4 of 5 criteria OR Passes 5 of 5 criteria but does not meet the requirements for good condition within criterion C		Moderate (2)	✓
Passes 2 or fewer of 5 criteria		Poor (1)
